ROBLOX STUDIO EXPERT SKILLS · TEAM SKILL 1 OF 14

Technical Direction

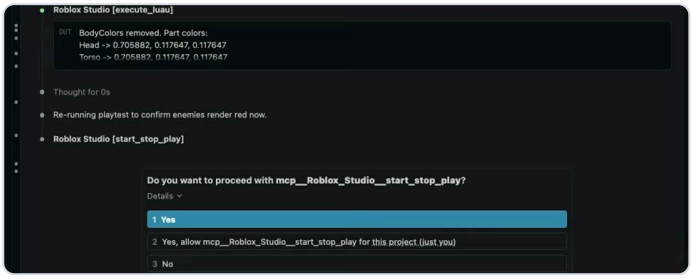

Technical director, lead Roblox engineer

`scenario-roblox-expert`

Drives Roblox Studio without a mouse through its built-in MCP server, passes each step only on parsed results, frame budgets and captures, and routes each domain to its specialist.

Live contact sheet, Studio 0.743: edit before and after from fixed cameras, then playtest. 36 live tests pass.

An agent drives Studio over its MCP server: execute_luau, then start_stop_play. Roblox Learn, 00:02:38.

USE IT WHEN

- Make a Roblox game, or build, fix or test anything in Studio by agent
- MCP server lists no Studio, a playtest hangs, or 2019 to 2023 code breaks
- A brief spans UI, data, networking or combat and needs the right specialist

WHAT THE EXPERTS INSIST ON

- Audit the results of anything an agent made over the Studio MCP; tool text is not proof that it worked.
  Jasmine and Alex (Roblox PM and engineer)
- A CI gate on type and lint errors catches 90 percent of what breaks a game. CJ_Oyer (independent developer, three Accelerator internships)
- One feature per prompt; AI does not automatically have taste, so a human judges the look and feel. SmartyRBX (educator)
- Follow every working answer with a security review prompt, then test death and respawn. SimTek (game development channel)
- A Rojo reconnect deletes instances that exist only in Studio unless the project sets $ignoreUnknownInstances.
  Distracted Games (Rojo tutorial channel)

WORKFLOW, WITH THE GATE BEFORE EACH NEXT STAGE

1. **Brief in numbers. Gate:** Every later check has a number: devices, players, memory, art style.
2. **Open own place. Gate:** open_places() lists it once; the Audit tally shows no error.
3. **Baseline. Gate:** Spec tests fail first; fixed-camera captures and playtest frame stats recorded.
4. **Build one stage. Gate:** One feature in idempotent chunks or files; domain work routed to its owner.
5. **Measure. Gate:** rbx_check 0 errors, Spec green, frames p95 at most 20 ms, worst 33.3 ms.
6. **Look and check. Gate:** Same cameras, image_checks ok, before and after compare changed, contact sheet opened.
7. **Deliver with evidence. Gate:** Verified and Assumed listed, plus what a human must still play for feel.

KEY NUMBERS

One execute_luau round trip, Edit	**67 ms**
Playtest ready, first place open	**4.2 s and 18.3 s**
Frame gate at 60 fps	**p95 at most 20 ms, worst at most 33.3 ms**
Healthy empty place in a playtest	**60 fps, p95 17.5 ms; a bare 16.67 ms gate fails it**
Studio process per open place	**about 2.9 GB; 3 agents at most by default**
Items per chunk before task.wait()	**about 1,000, or Studio freezes and the MCP drops**

CHECKS THE AGENT RUNS ON ITS OWN WORK

- rbx_check reports 0 errors with luau-lsp and Roblox definitions, on both type solvers.
- Spec tests: 0 failed and more than 0 in total, after one red run.
- Audit error tally 0, deprecated APIs gone, console clean after the playtest.
- Every capture passes image_checks; a contact sheet under 1,600 px is opened and judged.

HANDOFFS

Receives A Roblox brief: target devices, players per server, sync tool, and which place is the agent's own.

Delivers The shared toolkit to 13 specialists, and handoff packets: place, channel, numbers, evidence paths, Verified, Assumed.

TOOLKIT `RBX_RUN.PY, RBX_PLAY.PY, RBX_REVIEW.PY`

- `run()`: Luau in Studio, returns ok, result, error, output
- `Playtest()`: one server and client, keys, walking, captures
- `compare()`: before and after captures, changed fraction
